

ABOUT THIS PROJECT:

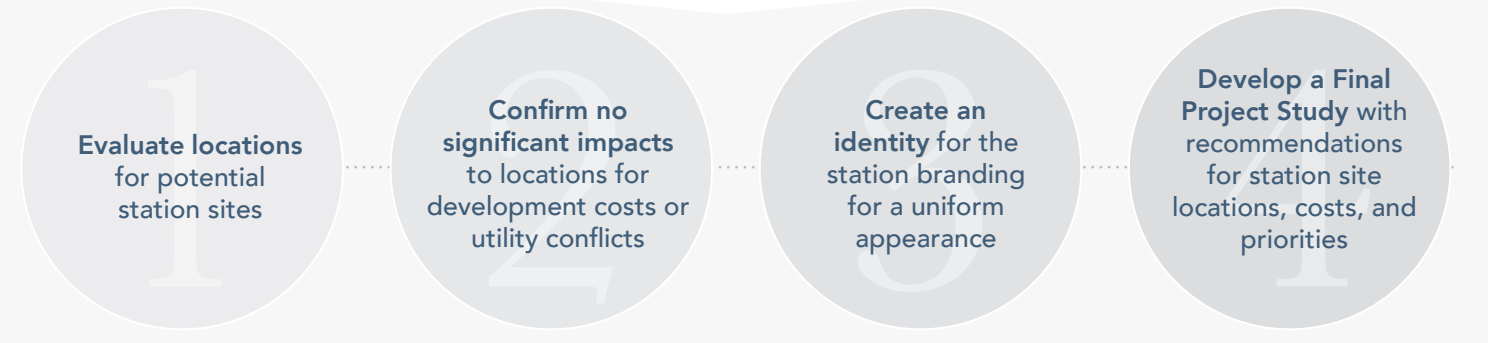

The City of Scottsdale Bicycle Station Study is a project to identify potential bike parking station locations and to define a list of amenities for future development. This project will evaluate 25-30 locations in an area south of Indian Bend Road to McKellips Road, between the Phoenix city limits and Pima Road. A station concept program will identify common facility elements for these sites. This will be provided as a list of amenities for the various station features (bike parking, map panels, signage, shade, site amenities, defined station boundaries, decorative pavement, lighting, etc.) to ensure these stations are consistent and identifiable. These stations will be used to consolidate the bike share operators within the City of Scottsdale, but will also allow private ownership bicycles to be parked at these locations. This study will evaluate and recommend potential locations, and a station element concept, to a 15% level design, will be developed.

The progress to date includes data collection of existing conditions and relevant design criteria. Sites have been photo documented, and an analysis of location conditions has been conducted. Site opportunities and constraints have been defined, and a preliminary matrix of findings and assessment values has been developed. A conceptual station design element list is also in progress to identify common elements for these sites.
