1.0 Introduction

1.1 Project Introduction

The City of Scottsdale aims to alleviate traffic congestion by upgrading the road along Carefree Highway that ties into Scottsdale Road (Project Number 3010.0100309.000). The proposed solution is to expand the existing two-lane road to a four-lane road, which will increase the road's capacity and improve traffic flow.

The proposed project also aims to mitigate flooding risks and control the water flow in the area. Moreover, the project will enhance the overall safety of the road by improving visibility and providing adequate space.

The purpose of this report is to identify necessary improvements that can address future development requirements, enhance drainage infrastructure to accommodate roadway improvements, and improve connectivity and access management throughout the corridor. The assessment aims to identify the specific improvements needed to make the roadway more efficient and functional, ensuring that it can meet the demands of future development and traffic flow while also enhancing safety and accessibility for all road users. The widened roadway section will tie into the existing grades. The drainage design was updated to account for increased flows resulting from increased roadway width.

1.2 Project Background

Currently, there are seven direct access points on the northside and three on the southside. This project is needed to widen Carefree Highway from one lane to two lanes in each direction between Cave Creek Road and Scottsdale Road.

1.3 Project Location

The project is located along the existing alignment of Carefree Highway beginning east of Cave Creek Road tying into the intersection of Scottsdale Road. The project length is approximately 1.8 miles. It is located in Sections 08, 09, 10 of Township 5 North, and Range 4 East of Gila and Salt River Base Line and Principal Meridian.

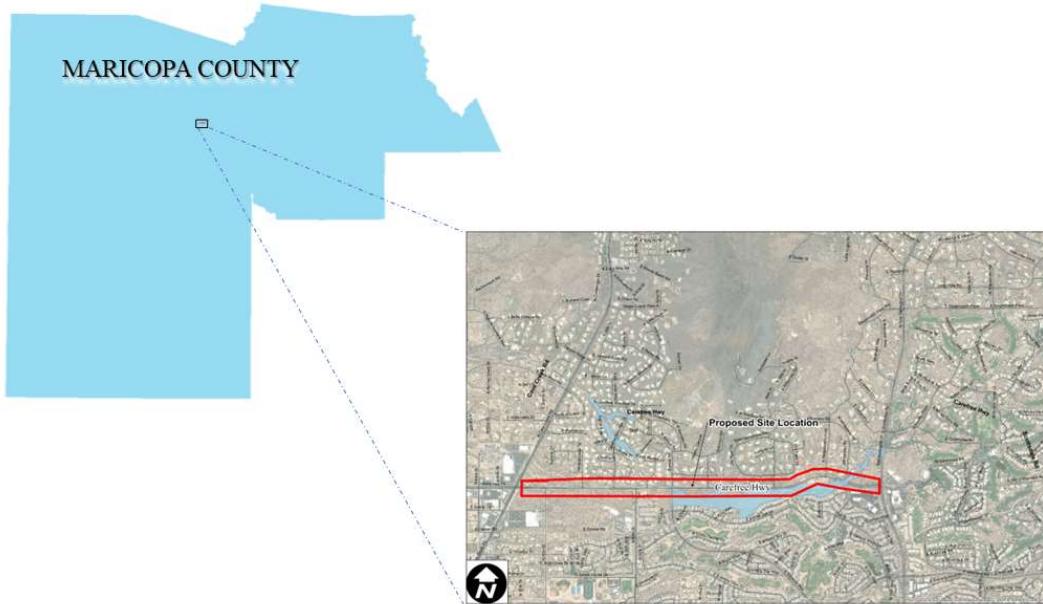

Figure 1-1 Vicinity Map

1.4 Existing Features

The existing corridor consists of a two-lane paved roadway adjacent to residential communities. The existing right-of-way (R/W) width along Carefree Highway is approximately 55 ft north of the centerline and 75 ft south of the centerline. Most of Carefree Highway does not have curb and gutter. In the City of Scottsdale Major Streets and Routes Plan, Carefree Highway and Scottsdale Road are classified as principal arterial roadways.

2.0 Overview

This report documents the drainage improvements for Carefree Highway from Cave Creek Road to Scottsdale Road (see Figure 1-1). The purpose of this study is to: (1) Provide an overview of the drainage conditions affecting the Carefree Highway project lane extension; (2) Perform site reconnaissance and compile background data; (3) Review and compare results of previous hydrologic studies; (4) Perform an up-to-date project specific hydrologic analysis referencing previous drainage studies to determine offsite storm water flows; (5) Evaluate onsite roadway storm water flows based on the proposed roadway design; (6) Determine the type and combination of drainage facilities required to handle offsite and onsite flows; and (7) Provide hydraulic calculations for the proposed design for offsite and onsite improvements.

2.1 Previous Studies

The offsite hydrology for the Cave Creek Unnamed Central Tributary located along this project was obtained from the 2003 Carefree Drainage Master Plan FDS, prepared by CH2M HILL, which is also reflected in the effective FIS for the 1-percent annual chance flood event. The effective

discharge shown in the FIS study is 2,849 cfs, located at River Station 0.9888. Cross Section A (RS 0.9888) is located approximately 300-feet upstream of Terravita Way / N. Sunset Trail.

2.2 Existing Conditions

The project extends along Carefree Highway east of Cave Creek Road and ends at Scottsdale Road. Project limits are shown graphically in **Figure 2**. Carefree Highway exists as a paved rural two-lane road without curb and gutter between Cave Creek Road and Scottsdale Road. From just east of Cave Creek Road to Scottsdale Road, vertical curb and gutter will be constructed along Carefree Highway. The road will be widened to two lanes in each direction, starting just east of the intersection of Carefree Highway and Cave Creek Rd.

Currently, there are 8 existing culverts located along Carefree Highway and all of the existing culverts are proposed to be extended or improved to match the existing drainage system. To enhance the management and regulation of stormwater flow resulting from the construction of new roads, 6 additional culverts are proposed to be constructed along Carefree Highway. These culverts will facilitate the smooth and efficient conveyance of stormwater, ensuring that the roads remain accessible and safe for public use.

The Cave Creek Unnamed Central Tributary runs primarily along the south side of Carefree Highway with crossings just east of Stagecoach Pass and west of Sunset Trail/Terravita Way. Both crossings exist as at-grade low flow crossings where traffic is impeded during high flow events. The 100-year flow at the crossing of Stagecoach pass is approximately 2,447 cfs.

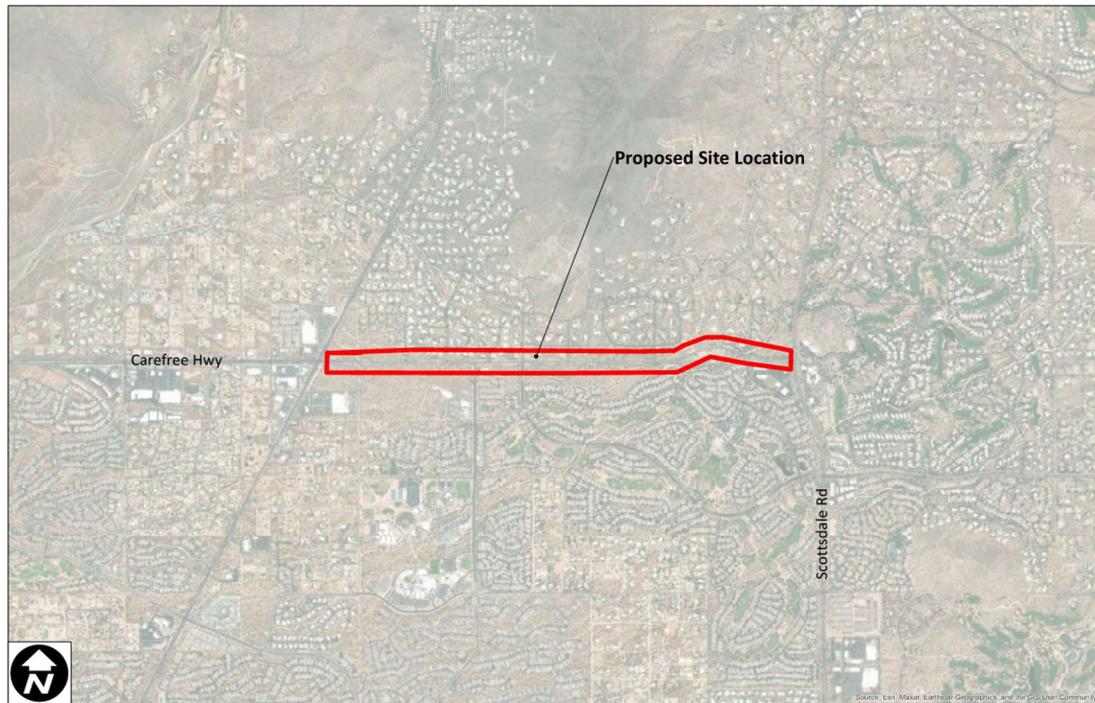

Figure 2-1 Project Limits

2.3 Federal Emergency Management Agency (FEMA) Special Flood Hazard Areas

A review of the effective Flood Insurance Rate Maps (Map No. **04013C0891M & 04013C0890M**) indicates that the project length lies within unshaded Zone X which is described as “*Areas determined to be outside the 0.2% annual chance floodplain*”. The project length also lies within shaded Zone X which is described as “*0.2 Annual chance flood hazard, areas of 1% annual chance flood with average depth less than one foot or with drainage areas of less than one square mile*”. A small portion of roadway also lies with Zone AE along Cave Creek Unnamed Central Tributary; Zone AE is described as “*Special Flood Hazard Areas with Base Flood Elevations or depths determined*”.

See **Appendix A** for the FEMA FIRMette maps and the digital appendix for the full FEMA FIRM maps.

2.4 Partnering/Stakeholders

2.4.1 City of Scottsdale

The lead agency regarding the design and construction of the proposed improvements. Carefree Highway serves as a dividing line between the City of Scottsdale and City of Carefree city limits.

2.4.2 City of Carefree

The City of Carefree is located along the northern boundary of the project limits.

2.4.3 Flood Control District of Maricopa County

The Zone AE floodplain for the Cave Creek Unnamed Central Tributary runs along the southern boundary of the project and crosses Carefree Highway in two locations. A LOMR will be required as part of the project improvements.

3.0 Drainage Design Criteria

3.1 Design Criteria

The design criteria for the referenced project are provided below. Design references are from the following:

1. City of Scottsdale. (2018). *City of Scottsdale Design Standards and Policies Manual (DSPM)*.
2. Flood Control District of Maricopa County (FCDMC). (2018). *Drainage Policies and Standards Manual for Maricopa County, Arizona (DPS)*.
3. Flood Control District of Maricopa County (FCDMC). (2018). *Drainage Design Manual for Maricopa County, Arizona, Volume I: Hydrology*.
4. Flood Control District of Maricopa County (FCDMC). (2018). *Drainage Design Manual for Maricopa County, Arizona, Volume II: Hydraulics*.
5. Flood Control District of Maricopa County (FCDMC). (2018). *Drainage Design Manual for Maricopa County, Arizona, Volume III: Erosion*.

The design of drainage improvements for Carefree Highway was prepared using the following list of specific design criteria referenced from the design manuals identified above.

**Table 3-1 Drainage Design Criteria**

Description of Criteria	Values for Design	Design Reference
<i>Offsite Hydrology</i>		
Rational Method	Drainage areas up to 160 acres Minimum Tc = 5 minutes	DSPM 4-1.504 FCDMC DDM Hydrology 3.6.1
Runoff Coefficients	Weighted Adjustment for Desert Areas: 0.37 and 0.45 (10-year & 100-year) Paved Street: 0.9 and 0.95 (10-yr & 100-yr)	DSPM 4-1.504 (Figure 4-1.5)
HEC-1 Flood Hydrograph Package	Drainage area greater than 160 acres	DSPM 4-1.504
Infiltration/Soil Loss	Green and Ampt	DSPM 4-1.504
Design Storm	Higher of 6-hr or 24-hr storm	DSPM 4-1.504
<i>Street Drainage (Parkways, Arterials, Collectors)</i>		
10-year storm	Flow kept between the curbs while maintaining a 12-ft dry lane in each direction.	DSPM 4 Figure 4-1.2
100-year storm	Flow kept within the right of way	DSPM 4 Figure 4-1.2
Depth	8-inches max during 100-year storm	DSPM 4
Manning's n-value	0.015 - paved	FCDMC DPS 6.5.4
<i>Pipe Culverts</i>		
Diameter	18-inches minimum diameter (Roadway) 15-inches minimum diameter (Driveway)	DSPM 4-1.206
Outlet Velocity	15 fps maximum	FCDMC DSP Table 6.7
Design Storm	Major Collector & Arterial = 50-year, no overtopping, 100-yr dmax = 6 inches Local & Minor Collector = 10-year, no overtopping, 25/50-yr dmax = 6 inches, 100-yr dmax = 12 inches	DSPM 4-1.204
Cover	18-inches minimum	MCDOT 4.7.7.1
End Treatment	Flared End Sections for pipes < 30 inches Concrete Headwall for pipes >= 30-inches	FCDMC DPS 6.7.7
Water Surface Elevation	Max WSE no greater than lowest adjacent road subgrade	FCDMC DSP Table 6.7
<i>Box Culverts</i>		
Height	4-feet minimum	FCDMC DPS 6.12.2
Cover	12-inches minimum	MCDOT 4.7.7.1
Design Storm	Major Collector & Arterial = 50-year, no overtopping, 100-yr dmax = 6 inches Local & Minor Collector = 10-year, no overtopping, 25/50-yr dmax = 6 inches, 100-yr dmax = 12 inches	DSPM 4-1.204
Water Surface Elevation	Max WSE no greater than lowest adjacent road subgrade	FCDMC DSP Table 6.7
<i>Storm Drains</i>		
Design Storm	Onsite: 10-year storm Offsite: 50-year storm	DSPM 4-1.206

Lateral and Connector	18-inches minimum	DSPM 4-1.206
Main Line	18-inches minimum	FCDMC DPS Table 6.9
Minimum Velocity	5.0 fps for Q_{design} Lesser of 3 fps for $0.5 \times Q_{design}$ or 3 fps at flow depth = 1 ft	FCDMC DPS Table 6.9
Maximum Velocity	15 fps	FCDMC DPS Table 6.9
Cover	Min cover per manufacturer's specifications	FCDMC DPS 6.6.2
Manholes	Required at all horizontal and vertical alignment changes, pipe junctions, and changes in pipe diameter	DSPM 4-1.206
Manhole Spacing	<= 30 inches: 330-ft max 33-45-inch: 440-ft max 48-84-inch: 660-ft max > 84-inch: 1320-ft max	FCDMC DPS Table 6.9
Pipe Diameter Changes	Pipe Crown Elevations Matched	FCDMC DPS Table 6.9
HGL (Q_{design})	=> 6 inches below inlet gutter flowline elev	DSPM 4-1.206
EGL (Q_{design})	< Gutter flowline elev	FCDMC DPS Table 6.9
Minimum Drainage Easement Width	Pipe outside diameter + 2 feet + 2 x depth to invert	DSPM 4-1.206
Manning's n	0.013 – Reinforced Concrete Pipe (RCP) 0.024 – Corrugated Metal Pipe (CMP) 0.013 – High-Density Polyethylene Pipe (HDPE) 0.016 – Cast-In-Place Pipe. Increase minimum size required for hydraulics by 6-inches.	FCDMC DPS Table 6.9
Utility Clearance	1 ft horizontal, 1 ft vertical 2 ft horizontal, 1 ft vertical (SRP)	FCDMC DPS 6.6.4
Open Channels		
Roadside Ditch Design Storm	50-year storm	DSPM 4-1.204
Freeboard	0 foot for roadside v-ditches	FCDMC 6.8.7
Maximum Side Slopes	2:1 soil cement 3:1 riprap 2:1 grouted riprap 4:1 earth/grass 1.5:1 concrete	FCDMC DPS Table 6.12
Required Fencing	steeper than 4:1 side-slopes depth > 3.0 feet	FCDMC DPS 6.2.7
Manning's n Values	Tables 7.6 and 7.7	FCDMC Hydraulics Manual
Storm Inlets/Catch Basins		
Clogging Factor	See Table 6.8	FCDMC DPS 6.5.12
Opening Height	6-inches maximum	FCDMC DPS 6.5.11
Spacing	12-foot dry lane each direction (10-year)	FCDMC DPS 6.5.9
Erosion Protection		
Culvert Outlet	V up to 1.3 x existing channel V, None V 1.3 to 2.5 x existing channel V, Riprap V greater than 2.5 x existing channel V, Energy Dissipator	FCDMC DPS Table 6.10
Roadside Swales	$V_{max} = 5$ fps	DSPM 4-1.204 (D)

4.0 Hydrology

4.1 Rational Method

Flow quantities for onsite and offsite hydrology were calculated using the Rational Method when areas are less than 160 acres. Criteria for the Rational Method specifically related to this project include:

- NOAA Atlas 14 rainfall and intensity data.
 - Rainfall data was gathered for the project site and found to be 0.48 inches (10-year, 5-minute rainfall depth). This rainfall depth is used for calculating rational method discharges.
- Total contributing drainage area to any individual concentration point must be less than 160 acres and must not have drainage structures or facilities that would require flood routing. For areas greater than 160 acres, the HEC-1 Flood Hydrograph Package is used.
- The maximum time of concentration is 60 minutes.
- The minimum time of concentration is 5 minutes.
- Runoff coefficients from Figure 4-1.5 in the City of Scottsdale Design Standards & Policies Manual.

The Time of Concentration (T_c) equation (equation 3.2 from the Drainage Design Manual for Maricopa County: Hydrology (FCDMC)) is used in an iterative equation with NOAA Atlas intensities to balance T_c with the correct intensity. The peak discharge is then solved directly using the appropriate intensity in Equation 3.1 (FCDMC).

4.2 HEC-1

For areas greater than 160 acres, flow quantities are calculated using the Flood Control District of Maricopa County DDMSW program and the Army Corps of Engineering Hydrologic Engineering Center's HEC-1 Flood Hydrograph Package, where rainfall excess is a function of precipitation and rainfall losses. Criteria for the Rainfall Loss Method specifically related to this project include:

- NOAA Atlas 14 rainfall and intensity data.
- Total contributing drainage area is greater than 160 acres
- The maximum time of concentration is 60 minutes.
- The minimum time of concentration is 5 minutes.
- Runoff coefficients from Figure 4-1.5 in the City of Scottsdale Design Standards & Policies Manual.

4.3 Precipitation

The National Oceanic and Atmospheric (NOAA) Atlas 14, Precipitation Frequency Atlas of the Western United States, Arizona was the source of the data used to determine the multiple rainfall depths and durations for the designed subbasins, respectively. See **Appendix B** for a summary of

the NOAA 14 data. **Table 4-1** shows a summary of the rainfall intensities for various storm frequencies that were used in the rainfall runoff calculations:

Table 4-1 NOAA Rainfall Data

Duration	Intensities					
	2 yr	5 yr	10 yr	25 yr	50 yr	100 yr
5 min	3.56	4.81	5.77	7.04	8.02	9.01
10 min	2.71	3.66	4.39	5.36	6.12	6.84
15 min	2.24	3.03	3.63	4.44	5.04	5.68
30 min	1.51	2.04	2.44	2.98	3.4	3.82
60 min	0.93	1.26	1.51	1.85	2.1	2.36

Within the DDMSW program, a shapefile of the watershed and subbasin boundary for BA-07 was imported to delineate the boundary. The District's program spatially averaged the rainfall data within the subbasin boundary resulting in a single average rainfall depth for the HEC-1 model. Within the HEC-1 model, the point rainfall was aerially reduced using JD records (depth/area relationship) to obtain an equivalent depth of rainfall based upon the contributing watershed.

4.3 Offsite Hydrology

The results from the 2003 Carefree Drainage Master Plan FDS and the effective FIS were used for the offsite hydrologic values of the Cave Creek Unnamed Tributary crossing Carefree Highway east of Stagecoach Pass, west of Terravita Way, and west of the intersection with Carefree Mountain Drive. Additional offsite subbasin boundaries contributing to flow reaching Carefree Highway were delineated and flows calculated using the Rational Method and HEC-1.

4.3.1 2003 Carefree Drainage Master Plan FDS Results

The Cave Creek Unnamed Tributary was analyzed by CH2M HILL as part of the Carefree Drainage Master Plan Floodplain Delineation Study (FDS). HEC-1 was used to model the hydrology of the area. The wash passes over Carefree Highway as a low flow crossing east of Stagecoach Pass. From there, the wash runs west along the south side of Carefree Highway until it reaches Terravita Way, where a flow split occurs. At Terravita Way, a portion of the flow passes under the road by means of a box culvert, and again under Carefree Highway just west of the Terravita/Sunset Trail intersection. The rest of the flow passes over the Terravita Way as a dip crossing, after which it passes through the north end of the Casa Montana subdivision, under 60th Street, and finally over Carefree Highway west of the intersection with Carefree Mountain Drive. See Appendix B for documentation of the HEC-1 results. **Table 4-2** shows a summary of the Carefree Drainage Master Plan FDS flows used in this study.

Table 4-2 Carefree Drainage Master Plan FDS Flow Summary

Location	Effective, Pre-Project, Post-Project 100-year Discharge (cfs)
At Scottsdale Rd.	1,652

At Carefree Highway, just East of Stagecoach Pass	2,447
300-feet upstream of Terravita Way (FEMA Cross Section A)	2,849
Flow Split North	2,092
Flow Split South	704

4.3.2 Pinnacle Peak ADMS FLO-2D Study

A more recent study of Pinnacle Peak West tributary was conducted by the Flood Control District of Maricopa County using FLO-2D, a two-dimensional modeling program. While the results of this study are not represented in the current FEMA FIS, they are used in the design of 3 culverts for this project. **Table 4-3** shows a comparison of the current FEMA FDS and the more recent FLO-2D study discharges. See **Appendix B** for a summary of the District's FLO-2D study results.

Table 4-3 FLO-2D vs Drainage Master Plan FDS Flows

Location	Drainage Master Plan FDS Discharge (cfs)	FLO-2D Study Discharge (cfs)
At Carefree Highway, just East of Stagecoach Pass	2,447	2362
Flow Split North	2,092	1792
Flow Split South	704	1138

4.3.3 Drainage Area Boundaries

The proposed project limits fall within Maricopa County jurisdiction and comprises two distinct watersheds, both of which have been identified for assessment. The boundaries of the watersheds are demarcated by Cave Creek Highway and East Cave Creek Road, defining the geographical scope of the study area. The drainage area contributing flow to the project area was subdivided into 13 areas. The drainage areas range in size from approximately 3.3 acres to 196 acres. All areas were less than 160 acres with the exception of area BA-07, which has an area of 196 acres. As a result, the HEC-1 flood hydrograph program was used to calculate the runoff for subbasin BA-07, while the Rational Method was used to calculate flows for the remaining 12 drainage areas. See **Exhibit 1** in **Appendix F** for the delineation of the offsite subbasin boundaries.

4.3.4 Land Use

Most of the land use in the project area was very low density/estate residential (R1-70) on slopes greater and less than 10% and mountain terrain, with smaller areas of natural desert, commercial, and medium density residential (R1-7). Runoff coefficients for these areas were obtained from the City of Scottsdale DPSM. These runoff coefficients were then area weighted to obtain a composite value to use for the 10-year, 50-year, and 100-year calculations. See **Appendix B** for a summary of the runoff coefficients used. For subbasin BA-07, a vegetative cover of 20% was estimated for mountain terrain areas. See **Exhibit 2** in **Appendix F** for a map of the project area land use.

4.3.5 Surface Type

The land use for the project area was also used to determine the surface roughness for each subbasin area. Table 3.1 from the Flood Control District of Maricopa County Hydrology Design Manual was used to assign surface types to each subbasin, from which equation parameters m and b were area weighted and used to calculate the Kb values used in the time of concentration calculations. See **Exhibit 3** in **Appendix F** for a map of the surface types in the project area.

4.3.6 Soils

The soil survey used for this project comes from the Natural Resources Conservation Service (NRCS) soil surveys contained within Book 651 titled *Maricopa County, Arizona, Central Part*. Soil data was used for BA-07 within DDMSW using the soil GIS shapefiles provided by the District and the delineated subbasin boundary. Refer to **Exhibit 4** in **Appendix F** for a map of the soils data for subbasin BA-07.

4.3.7 Rainfall Losses

Rainfall infiltration losses for basin BA-07 were calculated using DDMSW Ver. 5.6. The rainfall loss method used was Green and Ampt. The DDMSW program partially bases rainfall losses on both soils and land use data.

Surface retention losses include all rainfall losses not associated with infiltration. These losses include depression storage, absorption/infiltration and evaporation. For this project, these losses are based upon land use and surface cover. These values, for the initial abstraction, were applied to the basin in the DDMSW program.

The percent impervious input data is based upon a combination of soils and land use data. In the developed areas, representative values are included in the default parameters of DDMSW program.

4.3.8 Offsite Results

The Rational Method was used to compute the 10-yr, 50-yr, and 100-yr flow values for all subbasins contributing to the project area, with the exception of BA-07. The HEC-1 program was used to compute 50-yr and 100-yr flow values for both the 6-hr and 24-hr durations for subbasin BA-07. The 6-hr storm duration resulted in the highest flows and were used in design. The FEMA Q's listed in Table 4-2 show the flow values from the most recent study of the area: the Pinnacle Peak ADMS FLO-2D study. **Table 4-4** summarizes the flow results for each subbasin. See

Appendix B for a summary of the Rational Method calculations as well as the HEC-1 model output.

Table 4-4 Offsite Subbasin Discharge Summary

Subbasin	Culvert Station	Q (cfs)		
		10-yr	50-yr	100-yr
BA-01	129+98	7.7	13	16
BA-02	139+43	38	65	85

4.4 Onsite Hydrology

Carefree Highway is an existing roadway being widened to accommodate growth in the area. The onsite (roadway) hydrology was performed using the Rational method. Within the project limits, drainage areas were delineated and associated with the eastbound and westbound travel lanes.

4.4.1 Onsite Drainage Area Boundaries

The study area under consideration falls within the jurisdiction of Maricopa County and consists of two separate watersheds. Both watersheds have been earmarked for assessment. The boundaries of the watershed are determined by the presence of Cave Creek Highway and East Cave Creek Road, establishing the specific geographical extent of the project. See **Exhibit 6A** and **Exhibit 6B** in **Appendix F** for the Onsite Hydrology.

4.4.2 Onsite Results

The Rational Method was used to compute the 10-yr, 50-yr, and 100-yr flow values for each subbasin contributing to the project area. Table 4-3 presents a summary of the discharges calculated for each subbasin using the rational calculation method for a 10-year storm event. The discharge values for the 50-year and 100-year storms have also been calculated and included in **Appendix B** for further reference.

The rational calculation method is a widely used hydrological method that estimates peak discharge by considering the area of a catchment and the rainfall intensity. Analyzing the discharge

values for different return periods enhances the comprehension of the potential flood risks in each subbasin and allows for the development of appropriate mitigation strategies to manage these risks.

Time of concentration was calculated and results shown in **Appendix B**. The minimum time of concentration used was 5 minutes, in accordance with Flood Control District of Maricopa County. These times of concentration were input to calculate the contributing onsite flows of each subbasin. Times of concentration for the subbasins ranged from 5 minutes to 7 minutes, and contributing flows ranged from 1.3 cfs to 5.2 cfs for the 10-year storm event. See Table 4-5 for a summary of the 10-year onsite rational calculations.

Table 4-5 10-Year Onsite Rational Flows

Subbasin	Area	Q ₁₀

5.0 Hydraulics

5.1 Culverts

For the proposed drainage system, sixteen new culverts will be installed to control the flow of stormwater. The culverts will be designed to convey the 50-year flow without overtopping the roadway. Three culvert locations are located in a FEMA AE Flood Zone. These culverts were sized using the 100-year flows from the Pinnacle Peak ADMS FLO-2D model since no 50-year flow values were available. The design of these culverts will ensure efficient drainage and minimize the risk of flooding in the area. See **Appendix C** for HY-8 culvert design output.

5.1.1 Existing Conditions

Eight existing culverts are located within the project limits crossing under Carefree Highway, and one additional culvert crosses Mountainside Drive near the intersection with Carefree Highway. See **Appendix C.1.1** for the existing culvert HY-8 results and **Table 5-1** for a summary of the existing culvert analysis. No survey was available for the analysis of culverts 5.5 and 8.5.

Table 5-1 Existing Culvert Summary

ID	Station	Design Q 100-yr	Headwater Elev (ft)	Normal Depth (ft)	Critical Depth (ft)	Outlet Depth (ft)	Tailwater Depth (ft)	Outlet Velocity (ft/s)	Tailwater Velocity (ft/s)

5.1.2 New Culverts

All existing culverts will be replaced with new culverts, and additional culvert crossing locations have been identified for a total of sixteen new culverts required for drainage improvements. See **Appendix C.1.2** for the new culvert HY-8 results and **Table 5-2** for a summary of the new culvert analysis.

Table 5-2 New Culvert Summary

5.2 Channels & Ditches

5.2.1 Channels

Due to the proposed roadway encroachment into the existing Cave Creek Unnamed Central Tributary Wash, channelization of the thalweg is proposed from STA 178+75 to 184+95 along the south side of the roadway to maintain the flow area and capacity of the wash. The channel section will have a 20-foot bottom width with 4:1 side slopes. Because the proposed improvement impacts the existing wash, a CLOMR is provided separately for review and approval by City of Scottsdale and FEMA. Once construction is complete, a LOMR will be prepared for review and approval as well.

5.2.2 Roadside Ditches

The storm water drainage system is comprised of 17 roadside ditches designed to effectively manage the flow of offsite and onsite storm water resulting from the roadway improvements. These ditches have been carefully designed to ensure that they are capable of handling the 50-year peak discharge for offsite flows and 10-year onsite flows where applicable. The design also takes into consideration the slope and the elevation of the land to ensure that the flow of water is efficient and effective. The ditches are constructed using a variety of durable and reliable materials to ensure that they can withstand the harsh weather conditions and mitigate erosion. Overall, the design of the storm water drainage system aims to minimize the risk of flooding and ensure that the surrounding areas are safe and free from any potential water-related hazards.

The proposed roadside v-ditch sections vary with side slopes ranging from 2:1 to 4:1. The ditches are designed to effectively manage runoff during heavy rain events, carrying them to the nearest adjacent cross culvert and back to the natural wash. The Manning's roughness coefficient used for the development of the channel design was 0.025 for an earthen channel, 0.049 for $d_{50}=3"$ riprap, 0.069 for $d_{50}=6"$ riprap, and 0.073 for $d_{50}=9"$ riprap. See **Appendix C** for the channel and ditch design and **Table 5-3** for a summary of the results.

Table 5-3 Roadside Ditch Design Summary

6.0 Storm Drain System

StormCAD was used to model the onsite and three offsite storm drain systems. The captured flows, calculated using the rational method, from the curb and inlets were input into the StormCAD model. StormCAD was used to model the storm drain system hydraulic grade line (HGL) accounting for friction loss, junctions, bends, transitions, manholes and backwater conditions at the outfalls. The HGL is maintained at least 1-foot below the top of pavement. Tailwater at the outlet is the crown of pipe. The storm drain inlets, storm drainpipes, manholes and outlet summary tables and profiles are provided in in **Appendix D**.

6.1 Storm Drain Mainline

Three primary storm drain mainline systems were developed at the east end of the project to convey onsite runoff to the Cave Creek Unnamed Tributary. Multiple other small onsite systems were developed to convey flow to the nearest cross culvert or tributary. There are also two offsite storm drain mainline systems designed to capture and convey offsite flows to the nearest cross culverts and back to the main wash. All storm drain pipes are concrete. See **Table 6-1** for a summary of the storm drain systems conveying onsite flows. See **Table 6-2** for a summary of the storm drain systems conveying offsite flows.

Table 6-1 Onsite Storm Drain Summary

6.2 Catch Basins and Area Drains

The Carefree Highway project improvements include the addition of 6-inch curb and gutter along the length of the project. This requires new catch basins spaced along the curb to dewater the roadway by catching and conveying runoff to the proposed storm drain systems or to roadside ditches and channels. To adequately dewater the proposed roadway, 19 catch basins were required. All catch basins are curb opening catch basins (Type I) following MAG detail 542 with one or two wings. See **Table 6-3** for a summary of the catch basin design for the project. See **Appendix C.3.2** for a more comprehensive summary of the catch basin design.

Table 6-3 Catch Basin Design Summary

Inlet-134	Curb opening (M-2)	127+23	+39	37	6.1	13.5

1) See MAG Detail 542

Multiple offsite area drains are required to capture offsite flow and convey it in pipes to existing culvert crossings. See **Table 6-4** for a summary of the area drain inlets and **Appendix C.3.3** for additional details pertaining to the area drain design.

Table 6-4 Area Drain Design Summary

Inlet (ID)	Inlet Type ¹	Station	Offset (ft)	Captured Flow (cfs)
OFFSITE INLET 1	Catch Basin Type G	223+75	-50.8	18.02
OFFSITE INLET 2	Catch Basin Type G	222+37	-47.8	5.60
OFFSITE INLET 3	Catch Basin Type G	219+30	-45.8	9.21

OFFSITE INLET 8	Catch Basin Type G	207+60	-48.0	32.81
OFFSITE INLET 9	Catch Basin Type G	206+80	-46.2	4.64
OFFSITE INLET 10	Catch Basin Type G	205+20	-48.9	1.22

1) See MAG Detail 537

6.3 Scuppers

In addition to the catch basins, the roadway improvements also require 16 concrete scuppers located primarily along the west half of the project. Scuppers were used in place of catch basins at locations where roadway runoff could be drained directly into roadside ditches or nearby existing washes. The scupper design uses MAG detail 206 with a maximum curb opening length of 16 ft. See **Table 6-5** for a summary of the scupper design. See **Appendix C.3.2** for a more comprehensive summary of the scupper design.

Table 6-5 Scupper Design Summary

Inlet (ID)	Inlet Type ¹	Station	Offset (ft)	Inlet Total Opening Length (ft)	Captured Flow (cfs)	Calculated Spread (ft)
Inlet-111	OG Scupper	198+61	+39	16	1.1	5.5
Inlet-115	OG Scupper	190+64	+39	16	1.5	9.1
Inlet-116	OG Scupper	190+59	+39	16	1.8	10.0
Inlet-117	OG Scupper	186+95	+39	16	1.4	8.6
Inlet-118	OG Scupper	186+37	+39	16	1.8	10.1
Inlet-119	OG Scupper	180+59	+39	16	1.8	10.9
Inlet-121	OG Scupper	175+13	+39	16	2.0	9.9
Inlet-122	OG Scupper	168+58	+38	16	2.4	11.5
Inlet-127	OG Scupper	149+32	+38	16	1.9	10.2

Inlet-133	OG Scupper	133+17	+39	16	2.1	10.9
Inlet-135	OG Scupper	119+38	+39	16	2.7	12.7

1) See MAG Detail 206

6.4 Spread

Spread requirements during the 10-year storm event are to provide a 12-ft dry lane in each direction. Bentley's FlowMaster CONNECT Edition was used to calculate spread at each catch basin location to verify that requirements were met. Tables 6-2 and 6-5 provide the spread width at each inlet. See Appendix C.3.5 for a summary of the FlowMaster calculations.

7.0 Erosion Protection

Erosion protection is necessary where velocities within a ditch, channel, scupper, inlets and outlets of a culvert and outlets for storm drains exceed the natural ability of the native and/or engineered soil to resist erosion. Erosion protection generally performs two functions. The first is to prevent erosion while the second is to act as an energy dissipater to reduce velocities to non-erosive levels.

7.1 Culverts

Culvert inlet and outlet velocities dictate the need for erosion protection. If the flow velocities entering and/or exiting the culverts exceed the permissible flow velocity determined by the existing conditions soil characteristics, then erosion protection is necessary to prevent scour of the up and downstream wash beds.

Erosion protection measures have been determined for the proposed condition culverts using the results of the Federal Highway Administration's HY-8 culvert models and the District's River Mechanic's module and DDMS/W software. The design of the culvert riprap aprons is summarized below in **Table 7.1**. See **Appendix D** for more extensive calculations and program results.

Table 7-1 Culvert Riprap Apron Summary

Station	Type	Material	Dimensions	Discharge (cfs)	Outlet Velocity ¹ (fps)	Calculated ² Rock D ₅₀ (ft)	Design Rock D ₅₀ (in)	Apron Thickness (ft)	Apron Width (ft)	Apron Length (ft)
130+00	Arch	concrete	28.5"x18"	15	5.38	0.77	9	1.8	7.1	12.5
139+50	Pipe	concrete	3-24"	65	11.79	3.69

215+65	Box	concrete	5-10'x6'	2362	19.98	10.59				

1) Culvert output from HY-8 models

2) Calculations from FCDMC's DDMSW-River Mechanics - Riprap

3) Riprap Apron Dimensions from FCDMC Manual, Volume II, Chapter 8

As presented above, there are locations identified in Table 7.1 showing high flow velocities which are not suited to the design of riprap erosion protection as indicated by the need for very large rock (D50). In these locations other measures could be employed including:

- Concrete aprons (with or without energy dissipators)
- Grouted Rock
- Gabions
- other channel liners (multiple products exist), and
- a combination of solution types

7.2 Ditches and Channels

Velocities along the wash range from 6-10 fps and the thalweg runs right along the southern roadway embankment between STA 178+75 to 184+95. Erosion protection is proposed along the

right bank of the wash and south embankment of the roadway from STA 177+35 to 204+59, with both d₅₀=12" and 18" sizes depending on the velocities in the wash. A summary of the riprap proposed along the wash is provided in Appendix C.2.1.

For ditches where velocities exceed 5 fps, per City of Scottsdale DSPM, or if the flows are supercritical, loose riprap erosion protection is proposed. Riprap sizes range from d₅₀=3" to 9", depending on the slope and velocities of the ditch. A summary of the ditch design, including riprap for each ditch, is provided in Appendix C.2.2.

8.0 Flood Hazard Mitigation Measures

The widening of Carefree Highway and the addition of a multi-use path on the south side of the roadway encroaches on the Cave Creek Unnamed Central Tributary. The Tributary is a FEMA Zone AE floodplain. A Conditional Letter of Map Revision (CLOMR) will be provided in the preliminary drainage report at 60% to ensure no rise in the floodwater elevations.

9.0 Utility Conflicts

No potholes were obtained for this project. No utility conflicts are expected.

10.0 Conclusion

Onsite and offsite hydrology was analyzed to determine the impact of the Carefree Highway project improvements.

- Sixteen new culverts will be installed to control the flow of stormwater, replacing all existing culverts and improving the efficiency of the drainage system.
- Roadside and median ditches will be placed to convey runoff to roadway culverts.
- The roadway improvements include the addition of roll curbs requiring curb and median catch basins along the length of the project. All runoff collected in the catch basins will be conveyed to roadside ditches and channels and downstream culvert crossings.
- Two storm drain mainline systems at the east end of the project will collect onsite runoff and convey it to the Cave Creek Unnamed Tributary. Three offsite storm drain mainline systems capture and convey offsite flows to the nearest cross culverts.
- The widening of Carefree Highway encroaches on the Zone AE floodplain of the tributary and a LOMR will be provided in the preliminary drainage report at 60% to ensure no rise in floodplain elevations.

* DATA NOT AVAILABLE

Project: Carefree Highway (Cave Creek Road to Scottsdale Road)

Project Length: 2.1 miles

FLO-2D Results: FCDMC studies

- Pinnacle Peak West - Whisper Rock
- Pinnacle Peak West - Tatum Ranch

FLO-2D zone AE floodplain. Cross Section located 50-ft upstream of Terravita Way. Box culvert (north) and dip crossing (south) convey flow across Terravita Way (constitutes flow split) northwest and west of concentration point.

- Cross Section Number: 2
- Direction: west(4)
- Start Grid: 34,079
- End Grid: 26,060
- Length: 440.0 ft
- Maximum Discharge (cfs): 2,648.4
- Time of max. Discharge (hrs): 12.17
- Split flow (measured from FLO-2D results) NW: 1,792 cfs W: 1,138 cfs

FLO-2D zone AE floodplain. Cross section located 350-ft downstream of Carefree Highway (1,100-ft west of Scottsdale Road). Existing crossing of Carefree Hwy is dip crossing.

- Cross Section Number: 37
- Direction: southwest (7)
- Start Grid: 65,850
- End Grid: 59,242
- Length: 282.8 ft
- Maximum Discharge (cfs): 2,362.0
- Time of max. Discharge (hrs): 12.14

Carefree Highway Grid Summation (taken along roadway alignment)

- Length: 316.8 ft
- Maximum Discharge (cfs): 1,570.1

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

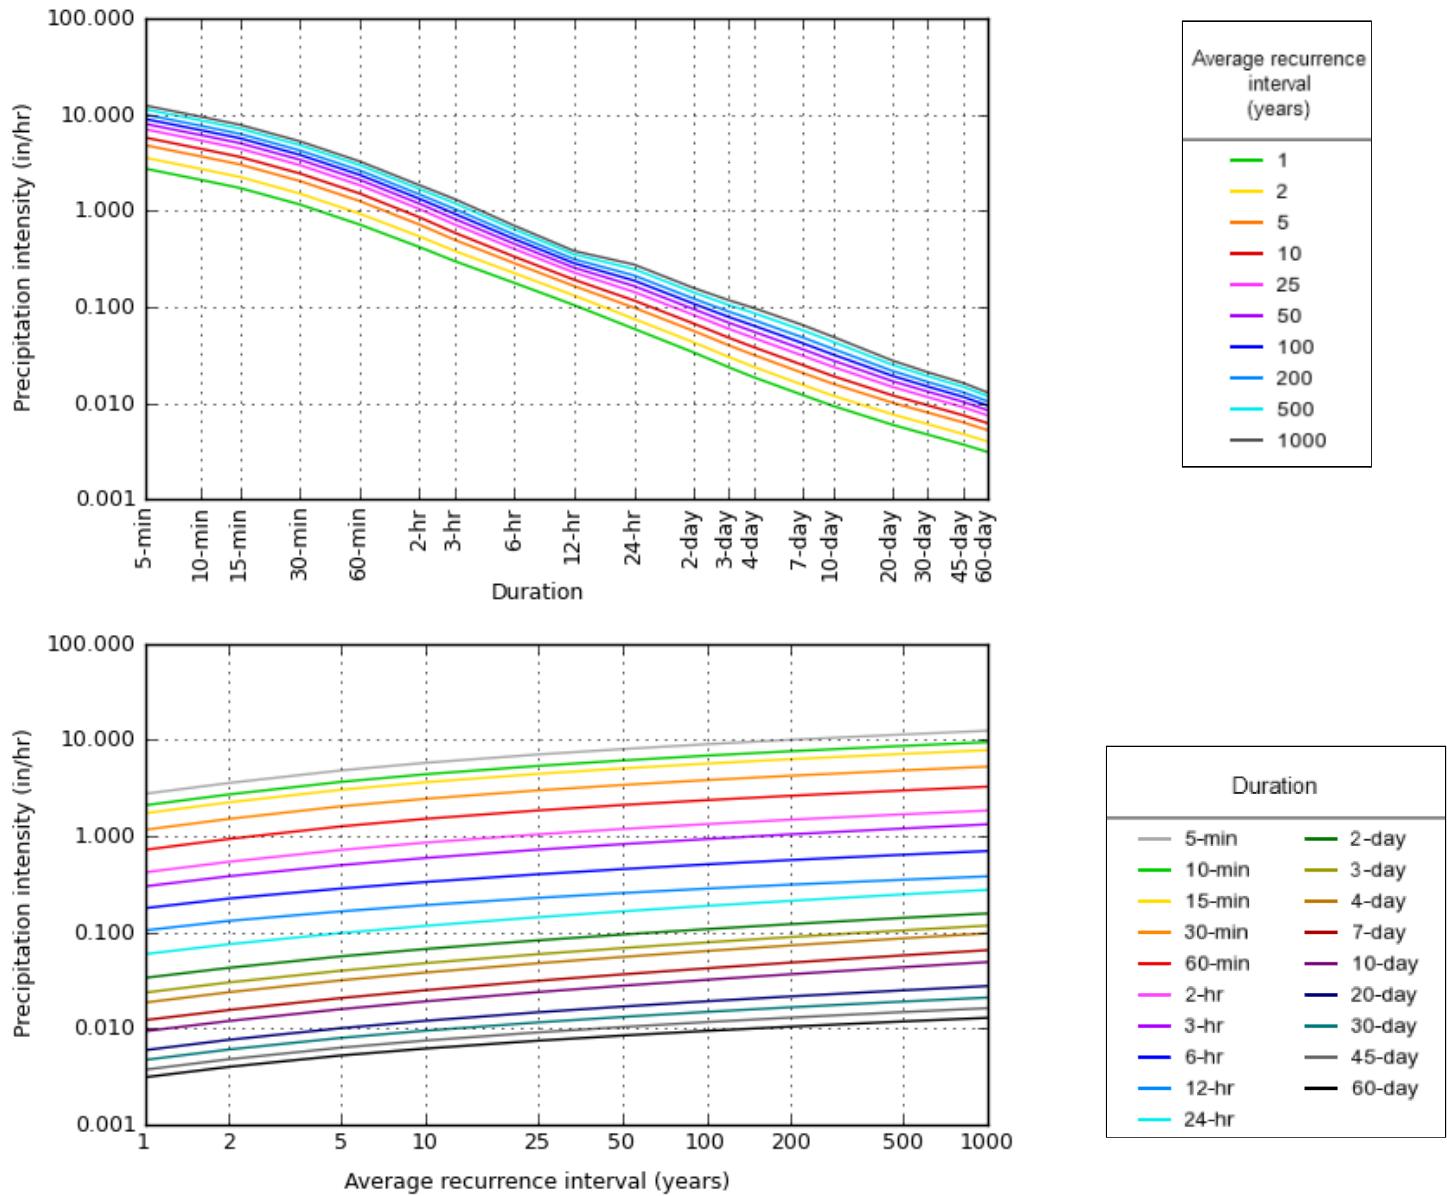

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
 THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
 NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
 DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL LOSS RATE:GREEN AND AMPT INFILTRATION
 KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

Culvert Barrel Data

Culvert Barrel Type Straight Culvert

Inlet Elevation (invert): 2064.77 ft,

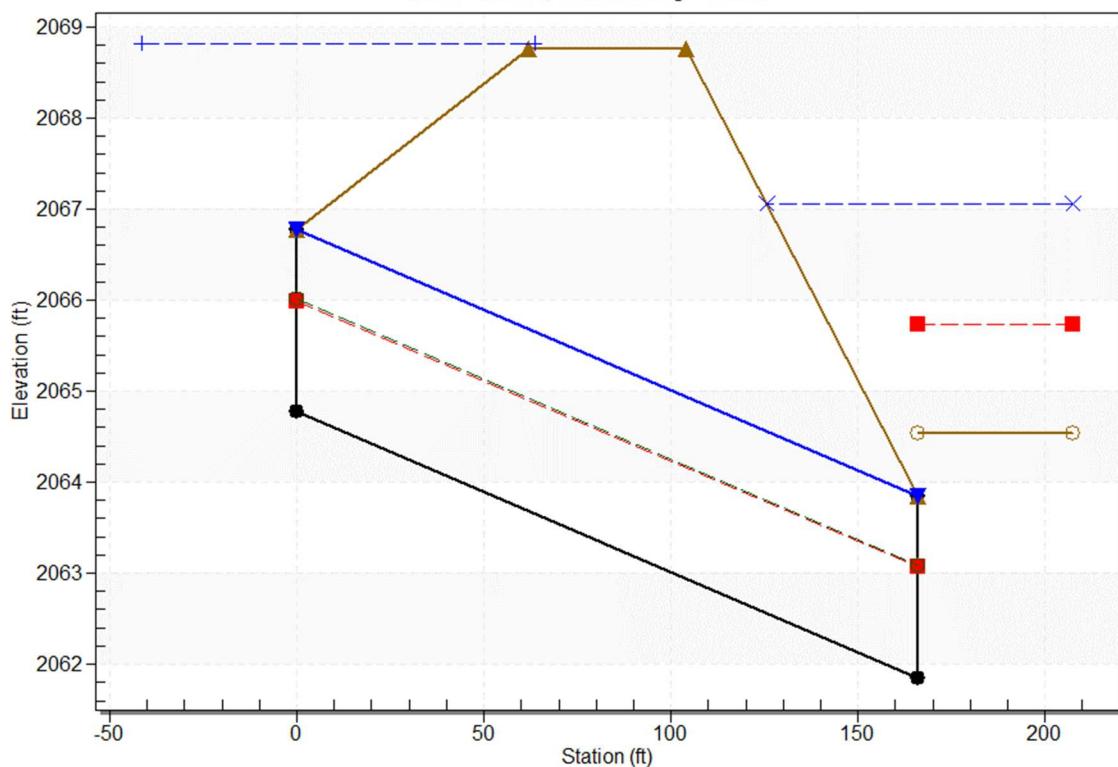

Outlet Elevation (invert): 2061.85 ft

Culvert Length: 166.04 ft,

Culvert Slope: 0.0176

Water Surface Profile Plot for Culvert: Culvert 1

Crossing - EX. 129+98, Design Discharge - 15.0 cfs
Culvert - Culvert 1, Culvert Discharge - 11.5 cfs

Site Data - Culvert 1

Site Data Option: Culvert Invert Data

Inlet Station: 0.00 ft

Inlet Elevation: 2064.77 ft

Outlet Station: 166.01 ft

Outlet Elevation: 2061.85 ft

Number of Barrels: 1

Culvert Data Summary - Culvert 1

Barrel Shape: Circular

Barrel Diameter: 2.00 ft

Barrel Material: Corrugated Steel
 Embedment: 0.00 in
 Barrel Manning's n: 0.0240
 Culvert Type: Straight
 Inlet Configuration: Square Edge with Headwall (Ke=0.5)
 Inlet Depression: None

Tailwater Data for Crossing: EX. 129+98

Table 2 - Downstream Channel Rating Curve (Crossing: EX. 129+98)

| Flow (cfs) | Water Surface Elev (ft) | Velocity (ft/s) | Depth (ft) | Shear (psf) | Froude Number |
|------------|-------------------------|-----------------|------------|-------------|---------------|
| 0.00 | 2064.53 | 0.00 | 0.00 | 0.00 | 0.00 |

Inlet Crest Elevation: 2161.35 ft

Water Surface Profile Plot for Culvert: Culvert 6

Crossing - EX. 168+50, Design Discharge - 23.0 cfs
Culvert - Culvert 6, Culvert Discharge - 23.0 cfs

Site Data - Culvert 6

Site Data Option: Culvert Invert Data

Inlet Station: 0.00 ft

Inlet Elevation: 2160.80 ft

Outlet Station: 160.40 ft

Outlet Elevation: 2153.67 ft

Number of Barrels: 2

Culvert Data Summary - Culvert 6

Barrel Shape: Circular
Barrel Diameter: 2.50 ft
Barrel Material: Concrete
Embedment: 0.00 in
Barrel Manning's n: 0.0120
Culvert Type: Straight
Inlet Configuration: Square Edge with Headwall
Inlet Depression: Yes

Tailwater Data for Crossing: EX. 168+50

Table 2 - Downstream Channel Rating Curve (Crossing: EX. 168+50)

| Flow (cfs) | Water Surface Elev (ft) | Velocity (ft/s) | Depth (ft) | Shear (psf) | Froude Number |

Water Surface Profile Plot for Culvert: Culvert 10

Crossing - EX. 192+24, Design Discharge - 100.0 cfs
Culvert - Culvert 10, Culvert Discharge - 100.0 cfs

Site Data - Culvert 10

Site Data Option: Culvert Invert Data

Inlet Station: 0.00 ft

Inlet Elevation: 2201.29 ft

Outlet Station: 71.30 ft

Outlet Elevation: 2200.21 ft

Number of Barrels: 1

Culvert Data Summary - Culvert 10

Barrel Shape: Circular

Barrel Diameter: 4.50 ft

Barrel Material: Corrugated Steel
 Embedment: 0.00 in
 Barrel Manning's n: 0.0240
 Culvert Type: Straight
 Inlet Configuration: Square Edge with Headwall
 Inlet Depression: None

Tailwater Data for Crossing: EX. 192+24

Table 2 - Downstream Channel Rating Curve (Crossing: EX. 192+24)

| Flow (cfs) | Water Surface Elev (ft) | Velocity (ft/s) | Depth (ft) | Shear (psf) | Froude Number |
|---------------|-------------------------|-----------------|------------|-------------|---------------|
| 0.00 | 2200.21 | 0.00 | 0.00 | 0.00 | 0.00 |
| 16.00 | 2200.95 | 0.74 | 2.71 | 0.46 | 0.56 |
| 32.00 | 2201.37 | 1.16 | 3.46 | 0.72 | 0.57 |
| 48.00 | 2201.73 | 1.52 | 3.96 | 0.95 | 0.57 |
| 64.00 | 2202.05 | 1.84 | 4.34 | 1.15 | 0.56 |
| 80.00 | 2202.36 | 2.15 | 4.65 | 1.34 | 0.56 |
| 100.00 | 2202.73 | 2.52 | 4.97 | 1.57 | 0.55 |
| 112.00 | 2202.94 | 2.73 | 5.13 | 1.70 | 0.55 |
| 128.00 | 2203.21 | 3.00 | 5.32 | 1.88 | 0.54 |
| 144.00 | 2203.48 | 3.27 | 5.50 | 2.04 | 0.54 |
| 160.00 | 2203.75 | 3.54 | 5.65 | 2.21 | 0.53 |

Tailwater Channel Data - EX. 192+24

Tailwater Channel Option: Rectangular Channel
 Bottom Width: 8.00 ft
 Channel Slope: 0.0100
 Channel Manning's n: 0.0400
 Channel Invert Elevation: 2200.21 ft

Roadway Data for Crossing: EX. 192+24

Roadway Profile Shape: Constant Roadway Elevation
 Crest Length: 100.00 ft
 Crest Elevation: 2206.24 ft
 Roadway Surface: Paved
 Roadway Top Width: 48.00 ft

HY-8 Culvert Analysis Report 195+53

Crossing Discharge Data

Discharge Selection Method: Specify Minimum, Design, and Maximum Flow

Minimum Flow: 0.00 cfs

Design Flow: 60.00 cfs

Maximum Flow: 80.00 cfs

Table 1 - Summary of Culvert Flows at Crossing: EX. 195+53

| Headwater Elevation (ft) | Total Discharge (cfs) | Culvert 11 Discharge (cfs) | Roadway Discharge (cfs) | Iterations |
|--------------------------|-----------------------|----------------------------|-------------------------|-------------|
| 2207.50 | 0.00 | 0.00 | 0.00 | 1 |

Culvert Barrel Data

Culvert Barrel Type Straight Culvert

Inlet Elevation (invert): 2134.97 ft,

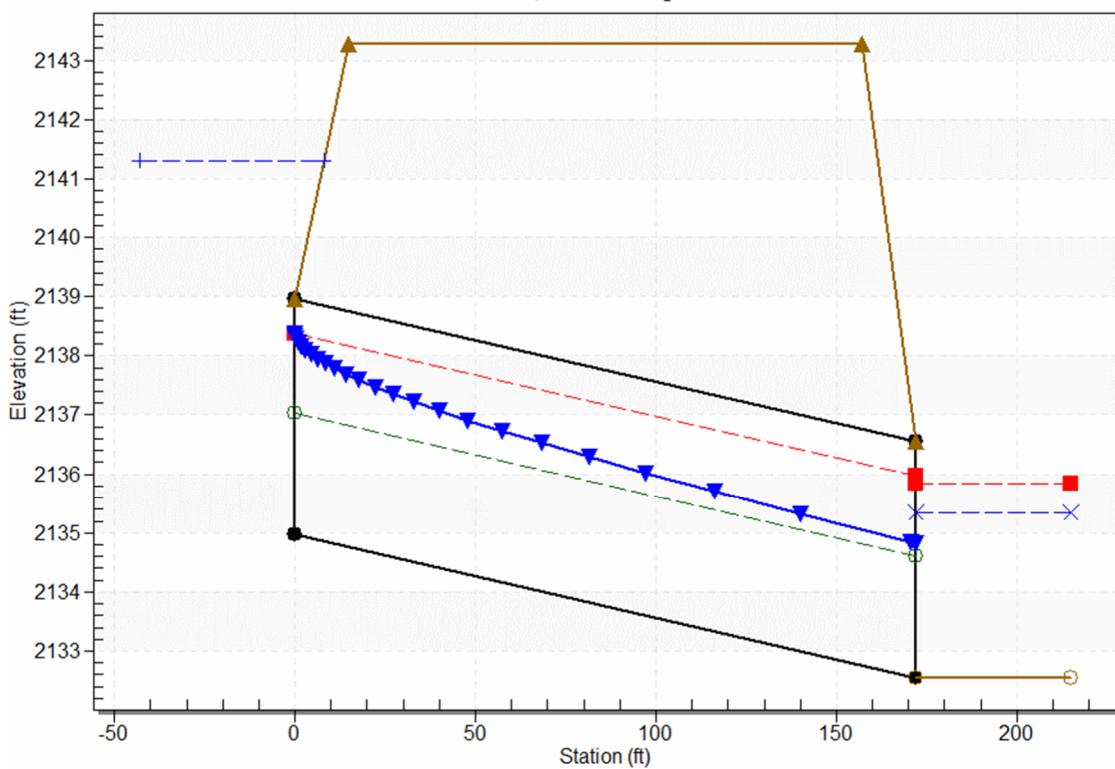

Outlet Elevation (invert): 2132.55 ft

Culvert Length: 172.02 ft,

Culvert Slope: 0.0141

Water Surface Profile Plot for Culvert: Culvert 1

Crossing - Box 161+75, Design Discharge - 1792.0 cfs
Culvert - Culvert 1, Culvert Discharge - 1792.0 cfs

Site Data - Culvert 1

Site Data Option: Culvert Invert Data

Inlet Station: 0.00 ft

Inlet Elevation: 2134.97 ft

Outlet Station: 172.00 ft

Outlet Elevation: 2132.55 ft

Number of Barrels: 5

Culvert Data Summary - Culvert 1

Barrel Shape: Concrete Box

Barrel Span: 10.00 ft

Barrel Rise: 4.00 ft
 Barrel Material: Concrete
 Embedment: 0.00 in
 Barrel Manning's n: 0.0130
 Culvert Type: Straight
 Inlet Configuration: Square Edge (90°) Headwall
 Inlet Depression: None

* Full Flow Headwater elevation is below inlet invert.

Culvert Barrel Data

Culvert Barrel Type Straight Culvert

Inlet Elevation (invert): 2170.09 ft,

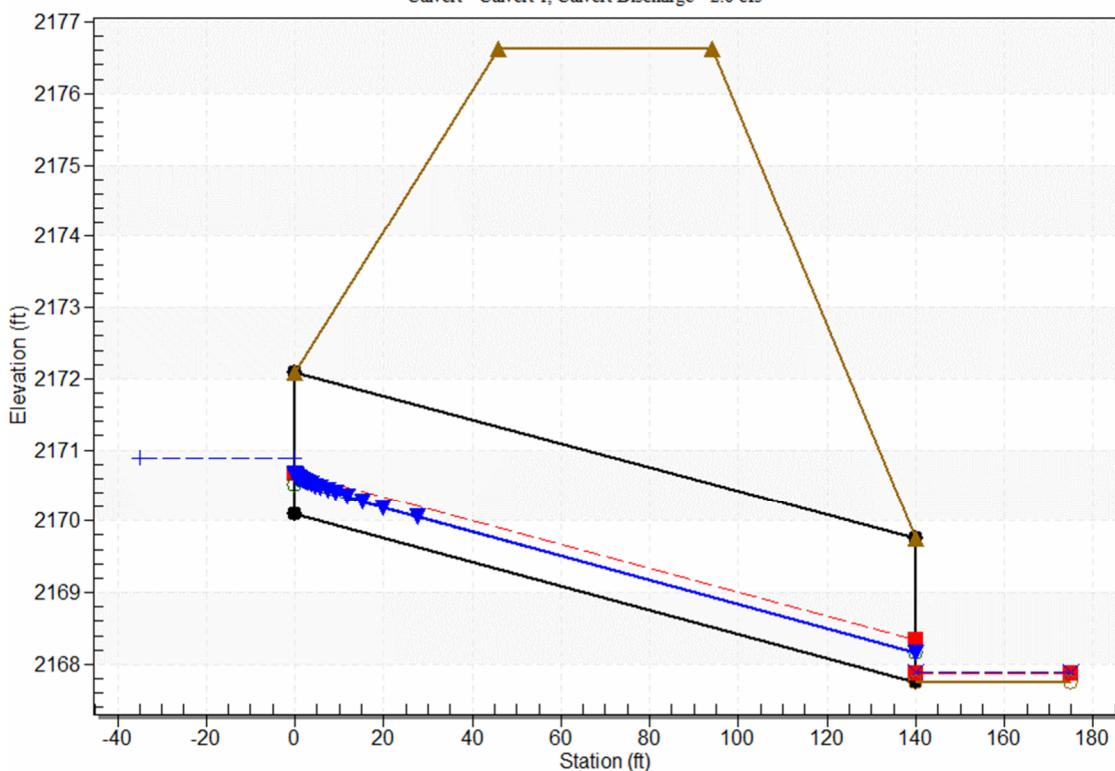

Outlet Elevation (invert): 2167.75 ft

Culvert Length: 140.02 ft,

Culvert Slope: 0.0167

Water Surface Profile Plot for Culvert: Culvert 1

Crossing - Pipe 174+06, Design Discharge - 2.8 cfs
Culvert - Culvert 1, Culvert Discharge - 2.8 cfs

Site Data - Culvert 1

Site Data Option: Culvert Invert Data

Inlet Station: 0.00 ft

Inlet Elevation: 2170.09 ft

Outlet Station: 140.00 ft

Outlet Elevation: 2167.75 ft

Number of Barrels: 1

Culvert Data Summary - Culvert 1

Barrel Shape: Circular

Barrel Diameter: 2.00 ft
 Barrel Material: Concrete
 Embedment: 0.00 in
 Barrel Manning's n: 0.0130
 Culvert Type: Straight
 Inlet Configuration: Square Edge with Headwall
 Inlet Depression: None

Tailwater Data for Crossing: Pipe 174+06

Culvert Barrel Data

Culvert Barrel Type Straight Culvert

Inlet Elevation (invert): 2184.75 ft,

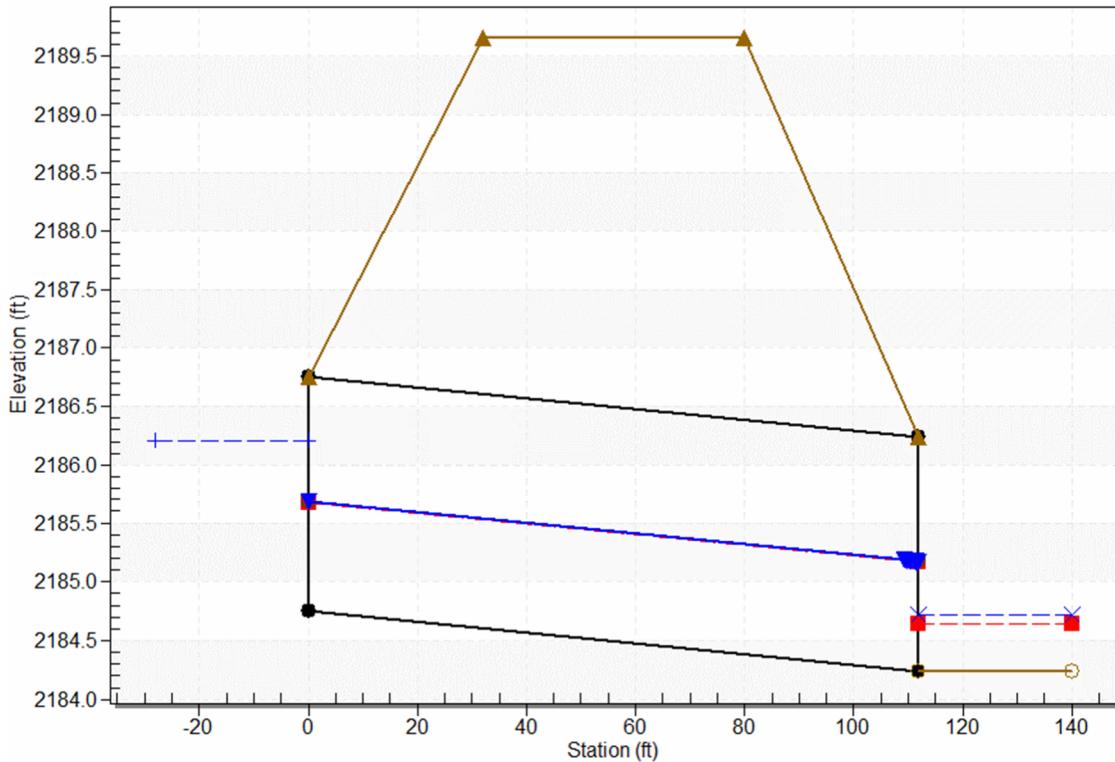

Outlet Elevation (invert): 2184.24 ft

Culvert Length: 112.00 ft,

Culvert Slope: 0.0046

Water Surface Profile Plot for Culvert: Culvert 1

Crossing - Pipe 183+00, Design Discharge - 6.8 cfs
Culvert - Culvert 1, Culvert Discharge - 6.8 cfs

Site Data - Culvert 1

Site Data Option: Culvert Invert Data

Inlet Station: 0.00 ft

Inlet Elevation: 2184.75 ft

Outlet Station: 112.00 ft

Outlet Elevation: 2184.24 ft

Number of Barrels: 1

Culvert Data Summary - Culvert 1

Barrel Shape: Circular

Barrel Diameter: 2.00 ft
 Barrel Material: Concrete
 Embedment: 0.00 in
 Barrel Manning's n: 0.0130
 Culvert Type: Straight
 Inlet Configuration: Square Edge with Headwall
 Inlet Depression: None

Roadway Data for Crossing: Box 215+65

Roadway Profile Shape: Constant Roadway Elevation
 Crest Length: 250.00 ft
 Crest Elevation: 2244.80 ft
 Roadway Surface: Paved
 Roadway Top Width: 142.00 ft

C.2 Channel & Ditch Calculations

C.2.1 Channels

FEMA Wash - Embankment Riprap Sizing

| Starting Station | Ending Station | d50 (in) | Riprap height (from channel bottom) (ft) | n-value ¹ |
|----------------------------------|----------------|----------|--|----------------------|
| 198+70 | 204+59 | 12 | 4.5 | 0.063 |
| 194+92 | 198+70 | 18 | 3.8 | 0.074 |
| 183+41 | 194+92 | 12 | 3.7 | 0.063 |
| 177+00
(tie in to box riprap) | 183+41 | 12 | 4.4 | 0.061 |

Notes: 1) n-value taken from Table 7.7 of Drainage Design Manual for
Maricopa County: Hydraulics, December 14, 2018.

C.2.2 Roadside Ditches

Project: Carefree Highway - Cave Creek Rd to Scottsdale Widening
Location: Scottsdale AZ
Date: 6/12/2024
Subject: Ditch/Channel Design Summary

Project Number: 3010.0100309.000
Project Engineer: M. Jacobsen
Checker: L. Vick

| Ditch ID | Road Alignment | Contributing Subbasins | From Station | To Station | Manning's 'n' | Lt Side Slope (ft/ft) | Rt Side Slope (ft/ft) | Max Channel Slope (%) | Channel Slope (ft/ft) | Required Channel Depth (in) | Required Channel Depth (ft) | Required Channel Width (ft) | Channel 50-Yr Flow (cfs) | Max Channel Velocity 50-yr (ft/s) | Notes |

- Notes:
 1) Effective opening for curb inlets is 80% for on Grade and 50% for Sump.
 2) Captured flow calculations were performed using Bentley Flowmaster V8i.
 3) Scupper openings are 3 (4-foot) per MAG STD DET 206
 4) Spread and gutter velocity calculated using Bentley FlowMaster program.
 5) Inlet Clogging Factor adjusts Length for total interception (Lt) by x1.25 per Pinal County Drainage Manual; Table 6.8
